TWENTY-FIFTH REPORT

OF THE

BOARD OF SUPERINTENDENCE OF THE DUBLIN HOSPITALS.

TO HIS EXCELLENCY JOHN POYNTZ, EARL
SPENCER, K.G.,

Lord Lieutenant-General and General Governor of Ireland,
do., do., do.

35, Dawson-street, Dublin,
3rd July, 1883.

MAY IT PLEASE YOUR EXCELLENCY,

We, the Board of Superintendence of Dublin Hospitals, have the honour to submit to your Excellency this our Twenty-fifth Annual Report and Statistical Returns for the year ended 31st March, 1883.

During the above period we have inspected the several Hospitals in this city which receive Parliamentary grants.

These are :—

1. Westmorland Lock Hospital.
2. The House of Industry Hospitals, viz. :—
 - a. Hardwicke Fever Hospital.
 - b. Whitworth Medical Hospital.
 - c. Richmond Surgical Hospital.
3. Steevens' Hospital.
4. Meath Hospital and County Dublin Infirmary.
5. Cork-street Fever Hospital.
6. Rotunda Lying-in Hospital.
7. Coombe Lying-in Hospital.
8. St. Mark's Ophthalmic Hospital; and
9. Hospital for Incurables, which receives a portion of the Concordatum Fund.

On these occasions we made careful inquiries as to the state and condition of each institution, its management and extent of accommodation; we visited the wards and other parts of the buildings to observe their condition, and the care and attention bestowed on the patients. We examined the dietaries in use, and the manner of serving the food to the patients, and inquired respecting such other matters as might assist us to supervise these institutions, and to report thereon in accordance with the provisions of the 18th section of the Act 19 & 20 Vic., cap. 110.

In these Hospitals, with one exception, applicants are admitted, provided there be available room, without any recommendation,

morely from being considered on examination by the Medical attendants to be fit objects for hospital treatment.

By this arrangement there are many advantages, for a patient labouring under acute disease is admitted without loss of time, which often occurs when the friends have to apply to Governors for an admission order.

The development of the telephonic system suggests the propriety of its application to hospitals. It is found that in the Charitable Infirmary, Jervis-street, where most of the surgical staff have their residences connected through the central exchange with the hospital, many advantages result from this contrivance.

We append in continuation of similar returns in previous Annual Reports, Tables showing the statistics of each Hospital for the year ending 31st March, 1883.

No. 1. The several sources from which income is derived.

No. 2. The expenditure in detail in respect to maintenance and establishment.

No. 3. The admissions, discharges, deaths—the average daily number in Hospital during the year—the average sojourn of each patient in Hospital, the extent of accommodation, &c.

No. 4. The average cost per bed occupied throughout the year, for maintenance, and for establishment, exclusive of building and furnishing such building.

On the 1st April, 1882, 726 patients remained in these Hospitals.

The number admitted during the year was 9,414 making the total under treatment 10,140, of whom 9,085 left the wards cured, relieved, or were dismissed for other causes.

The mortality was 4·6 per cent. on the cases estimated on the numbers who have been discharged, or who have died, or whose cases have consequently been treated to a termination.

816 patients remained under treatment in the wards on the night of the 31st March of the present year.

The total average daily number of beds occupied in all the Hospitals throughout the year was 719·47.

The time spent in Hospital by each patient under treatment, omitting the inmates of the Hospital for Incurables, averaged 20·28 days.

The Board of Superintendence find the greatest difficulty in obtaining the statistics and details from the different Hospitals in proper time for publication in their Report.

The chairman was determined last year that the Report should be published during the session of Parliament in which the inspections were made, instead of in the following year, as was formerly the practice, by which delay the Report was of very little use. Some of the Hospital authorities, however, seem to be determined to adhere to their former dilatory method, and the Board of Superintendence must state that the late publication of the Report is due to the impossibility of getting the Returns sooner. The chairman of our Board had to, in several cases, address three letters to the Boards of the Hospitals before we could get the Returns furnished.

THE WESTMORELAND LOCK.

We found this Hospital on inspection in a creditable condition of order and cleanliness.

The buildings were in sound repair, the wards were tidy, and the floors well scrubbed. The bedding, blankets, sheets, quilts, are all ample and of good description.

Since the date of our last Report several improvements have been effected, among which may be enumerated the general cleaning, whitewashing, and painting of the Hospital; the substitution of new strong timber lead-lined baths for patients in lieu of those previously in use. The drain which formerly ran under the kitchen floor has been done away with, and drainage directed into another course. All the sewers have been opened and thoroughly cleaned and repaired, and the flushing tank newly lined with cement.

Already a chapel for the Roman Catholic inmates was established many years ago and handsomely fitted up; but Divine service for the Protestant patients was conducted in their wards. This arrangement was not considered suitable or satisfactory, and accordingly an unoccupied and spacious ward has been set apart as a church. We have been informed that owing to the great prevalence of venereal disease amongst the troops composing the Dublin garrison, it has been suggested as a means of reducing this disease to increase the accommodation in this Hospital so as to render it more adequate to meet the demands made upon it. The War Department have proposed an offer (subject to the sanction of Parliament) which the Governors have accepted, of a supplemental grant of £250 a year for the maintenance of ten beds and to pay a further sum of £25 per bed per annum on the condition of new wards being opened for twenty beds. The grant in all not to exceed £500. This would enable the Governors to treat continuously the number of eighty patients as a daily average.

This Hospital has great claims on the State, for it prevents the spread of much misery and physical degeneration, and its sphere of usefulness would be much increased if patients could be induced to seek admission at the earliest stage of their disease.

There were 63 patients in this institution at the commencement of the year; 756 were admitted; 741 were discharged; 14 died, and 66 remained on the 31st March, 1883.

The mortality was 1·86 per cent. on the total number treated to a termination.

The time spent in hospital by each patient averaged 30 days, and the average daily number of beds occupied during the year was 67·49.

STEEVENS'.

On inspection, we found an improvement in the condition of all the departments of this Hospital with exception of No. 2 ward. This ward is allotted to venereal patients, and we were sorry to observe it in an unsatisfactory condition.

As a great part of good nursing consists in preserving cleanli-

ness, we naturally surmised that the patients do not receive due attention in this respect.

We were informed that no special nurse was attached to this ward. In our last Report we noticed with disapprobation the condition of this ward, and we regret that our suggestions have not since been carried out with regard to the appointment of a male attendant.

The nurses in the other wards appear to be of a superior class, intelligent and attentive to their duties. They are taught to carry out strictly the directions of the medical attendants.

We have so frequently referred in our recent Reports to the faulty system of water-closets, and to the defective arrangements for baths and lavatories in connection with the principal surgical wards, that we hope, should funds be available, that the Governors may consider the subject worthy of their serious attention.

The cooking arrangements appear to be satisfactory, and the food was excellent.

We visited the linen-room and laundry department, and found both in order. We ascertained that the soiled linen is invariably steeped and boiled, and when necessary disinfected, previously to being washed.

On the 1st of April, 1882, 122 patients remained in Hospital; 1,979 were admitted during the year; 1,912 were discharged; 33 died, and 151 remained on the 31st of March, 1883.

The average daily number of patients in Hospital was 126.27, and the stay in Hospital of each patient averaged 21.93 days. The mortality on those treated to a termination was 1.95 per cent.

MEATH.

This Hospital is favourably situated in an open space, and being surrounded by walks and laid out grounds offers great advantages for convalescent patients.

The many improvements recently carried out will tend much to efficient working of the service and promote the comfort and restoration to health of the patients. There were until lately buildings in close proximity to the rear of the Hospital, which are now being removed, and the open space belonging to the Hospital is being enlarged.

It is a matter of great importance to have had the water-closets removed from the main building and reconstructed outside the Hospital walls, and approached by lobbies suitably lighted and ventilated.

The space afforded by these changes in the main building has been utilized for increasing the accommodation in ward-kitchens and pantries.

We observed also that additional presses for linen and patients' clothes were provided.

The post-mortem room and mortuary have been removed from underneath the operating theatre to an adjacent building hitherto used as a laundry.

The new laundry situated underneath the theatre is fitted with a hot water circulating system, &c., but the means for the removal of the steam appears scarcely adequate.

On the occasion of our visit the upper story of the main building was close and ill-ventilated, and although the weather was particularly genial there was no window open either in the wards or in the corridor.

The air supply should not be regulated by the fancy of patients, but should be under the control of the nurse, provided she be sufficiently intelligent and well trained in her duties. We were informed that the nurse in charge of these wards was absent through illness. We suggest that each window be provided with a zinc plate (punctured from within outwards) in lieu of glass, which will insure a continuous change of air without admitting the rain.

We were glad to find that during the past year two observation wards have been erected, in which all doubtful cases will be placed and treated, until the true type of the disease manifests itself.

There has also been provided in connection with the fever wards, but external to the main building, a chamber in which all out-going patients will dress after receiving a bath, and thus be able to leave without going through the wards; these sanitary precautions will much tend to prevent the spread of contagious disease.

All the wards and corridors have undergone extensive repairs. The walls have been thoroughly scraped and oil painted.

There were 86 patients in this institution at the commencement of the year; 1,071 were admitted; 1,004 discharged; 69 died, and 84 remained on the 31st March, 1883.

The mortality was 6.43 per cent. on the total treated to a termination.

The time spent in Hospital by each patient averaged 23.44 days, and the average daily number of beds occupied during the year was 74.32.

CORK-STREET.

We found this Hospital in a very satisfactory condition as regards the comforts of the patients and the internal working of the institution.

The kitchen with scullery, pantries, and store-room, were in good order, and well lighted and ventilated. The cooking appliances are of the best description.

The returns from this Hospital show that its funds have been fairly aided by subscriptions.

The number of cases under treatment during the past year was less than in preceding years, which renders the cost per bed much higher than in other hospitals. This expenditure is to be accounted for by the necessity of maintaining a staff and establishment in readiness for any sudden increase in the number of patients. It would be unsafe to the community at large not to have a considerable number of spare beds always available to meet the requirements made upon the Hospital during the prevalence of epidemic diseases, such as fever, small-pox, scarlatina, &c. If such cases were refused admission for want of accommodation,

contagion would spread rapidly amongst the poor in their ill-ventilated homes.

In our Fourteenth Annual Report we adverted to the defective arrangements of the building known as the "Old House" in which small-pox patients were then treated. Each ward was so small and the superficial space so limited as to admit of but three patients. The beds were placed in corners and in contiguity to the walls. We considered this arrangement so unfavourable to proper ventilation, discipline, economy, and due attendance on the sick, that the Governors have since provided other accommodation for such patients.

We are glad to be informed that the Committee of the Convalescent Home for infectious diseases, have recently placed over £900 at the disposal of the Governors for the purpose of remodelling this part of the institution. An extensive contract has accordingly been entered on, which, when carried out, will render this building admirably suited to receive convalescent patients. Having the advantage of being in the Hospital grounds, and in proximity to the epidemic wards the foci of contagion will not be spread, and the control over such patients will not be diminished by attempts to remove them elsewhere often against their own will.

On the 1st of April, 1882, 25 patients remained in Hospital; 562 were admitted during the year; 457 were discharged; 46 died, giving a mortality of 9·14 per cent. on those treated to a termination.

The average daily number of beds occupied throughout the year was 32·39, and the time spent in Hospital by each patient under treatment was 20·14 days.

HOUSE OF INDUSTRY.

The patients were well cared, the food was of good quality, well cooked and properly served.

The wards were neat and orderly, there was an ample supply of bed-rests, arm-chairs and screens.

The prescription and diet cards were carefully written and hung over each bed. The linen appeared properly washed and changed sufficiently often.

We carefully examined the laundry and ascertained that the soiled linen was steeped and boiled, and when necessary disinfected previously to being washed.

We are glad to find that since the abolition of the steam engine, and the introduction of the new washing machine and Vartry water, considerable economy has been effected.

In reply to our inquiry as to the arrangements for the admission, maintenance, and treatment of the sick members of the Metropolitan Police Force, we have been informed that according to rule a preference is given in the admission of such cases above ordinary patients. There are no special wards allotted to them.

No payment is received from the Police Treasury for their maintenance, although the advantages of treatment in these

Hospitals is largely availed of by the members of the Force of all ranks.

During a period of 7 years ending 29th August, 1882, a total of 923 men were treated in the Richmond, Whitworth, and Hardwicke Hospitals. They occupied beds for the collective number of 21,743 days.

The Governors, in reply to a communication from the Police Inquiry Committee, Dublin Castle, agreed to provide special wards for the police on the understanding that a capitation allowance were given for members of the Force admitted as patients, but as yet no answer has been received to the application.

With the view of showing the necessity of reconstructing the Richmond Hospital, and of ascertaining the means for obtaining a loan for carrying out contemplated improvements, the following letter was addressed to the Assistant Under Secretary, which we insert with the reply:—

“20th March, 1883.

“*Sir*,—Referring to your letter of the 5th instant, together with the printed note on Hospitals and Infirmeries, I am requested to signify to you for the information of His Excellency the Lord Lieutenant, that the Board of Superintendence have on several occasions adverted to the faulty construction of the Richmond Hospital, and to the insanitary condition of its vicinity.

“In their Twentieth Annual Report to His Excellency the Lord Lieutenant they state, with regard to this Hospital, that ‘After much inquiry and consideration we find the service of the Hospital is carried out as well as present arrangements will admit, but we are of opinion that the general efficiency is interfered with by the faulty construction of the building, and the insanitary condition of its vicinity.

“With the exception of the new pavilion wing, consisting of two well-ventilated wards, no part of the building was designed for the purposes to which it is devoted. The corridors are narrow, dark, and imperfectly ventilated; and of the wards in the old building, the most favourable report we can make is, that the best endeavours have been made to render them suitable.

“We find the position of the water-closets most objectionable. The pupils’ closet opens directly on a corridor and on the Eye Department, and immediately over it is the closet for the patients upon the second landing. This closet opens almost directly upon the wide staircase, through which much of the air for the upper wards passes. The smell from all these centres is at times most offensive, and we are told that two of the Surgeons have suffered from illness which they attribute entirely to having been obliged to do some work in the Eye Department. We were informed that several of the patients, two of the nurses, and three of the resident pupils suffered from fever, of which one nurse died.

“There is no reception-room for extern patients, except the central hall, where large numbers are allowed to collect, contaminating the air, which afterwards is carried along the corridors into the wards.

“The extensive dairy yards, with collections of filth and reeking manure-heaps in close proximity to the hospital walls, must deteriorate the atmosphere, and the wonder is that disease due to such conditions is not more rife among the inmates.

“We observed, also, that the dead-house in which autopsies are made is placed directly under the seats of the operating theatre. It is obvious that this is a most unsatisfactory arrangement, and that the success of surgical operations is gravely imperilled by being performed in an atmosphere subject to such contamination.

“The Board of Superintendence are glad to state that since the above Report was issued, a commodious reception-room has been provided, shut off from the

passages leading to the wards, together with an ophthalmic department for extern patients—the old ophthalmic department being appropriated as a depository for splints and other surgical appliances.

"The Board of Governors of the House of Industry Hospitals have directed the abolition of the surgical dead-house, and patients who may now die in the Richmond Hospital are conveyed direct to the mortuary of the Medical Hospitals where all autopsies are made. The old dead-house is at present used for keeping plaster casts and other matters in connexion with the adjacent museum.

"The Board of Superintendence entirely concur in the sentiments contained in the letter of the Earl of Meath, as Chairman of the Board of Governors of the House of Industry Hospitals, and they consider that the only way in which the total unsuitability of the Richmond Hospital for its purpose can be remedied in a complete and effectual manner is by the pulling down of the present structure and its reconstruction on a proper hospital plan, and by the purchase of the surrounding area covered with the dairies and filthy stables, and most objectionable buildings, and the clearing of the ground and the conversion of it into an open grass area for the ventilation and aeration of the whole group of Hospitals, and the recreation of the patients. If the Government could see their way to any assistance towards this most desirable object, either by a loan or by the purchase of the land, they would confer an everlasting benefit upon the community.

"I am, sir, your obedient servant,

"(Signed)

POWERSCOURT,

"Chairman of the Dublin Hospitals Board.

"W. S. B. Knye, LL.D.,

"Assistant Under Secretary."

"Dublin Castle, 20th April, 1883.

"My Lord,—With reference to your letter of the 20th ultimo relative to a loan for the reconstruction of the Richmond Hospital and for the purchase of the surrounding land, I am directed by the Lord Lieutenant to acquaint you that His Excellency learns from the Board of Public Works that they can make loans to Hospitals if sufficient security is forthcoming, but the security should be found by transfer of stock or mortgage of land, and not out of the revenues of the year which can only be applied to the treatment and support of patients.

"According to existing Treasury Regulations the interest on a loan such as you desire for the Richmond Hospital would be at the rate of 5 per cent., and the period of repayment in previous similar instances was fixed at ten years.

"If, however, the Board of Works were made aware of the nature and value of the security forthcoming they would be in the position to submit the case to the Treasury with whom the decision rests, there being no special Act, both as regards terms of interest and repayment.

"I have the honor to be, my lord,

"Your obedient servant,

"(Signed)

R. G. C. HAMILTON.

"Viscount Powerscourt, K.P.,

"Chairman of the Board of Superintendence

"of the City of Dublin Hospitals."

HARDWICKE.

On the 1st of April, 1882, there remained in Hospital 18 patients; 482 were admitted during the year; 416 were discharged, and 56 died, giving a mortality of 11·84 on those treated to a termination.

The average daily number of beds occupied throughout the year was 27·39; and the time spent in Hospital by each patient averaged 19·99 days.

WHITWORTH.

Fifty-nine patients remained on the 1st of April, 1882; 692 were admitted, including one born, in the Hospital during the year; 615 were discharged; 63 died in the year ended 31st March, 1883, giving a mortality of 9.29 per cent.

The average daily number of beds occupied throughout the year was 527.4, and the time spent in Hospital by each patient averaged 25.63 days.

RICHMOND.

Seventy-seven patients remained under treatment on the 1st of April, 1882; 831 were admitted during the year; 804 discharged, and 37 died, giving a mortality of 4.39 per cent.

ROTUNDA.

On inspection we found that general order and neatness prevailed throughout this institution.

The wards and corridors were scrupulously clean and the floors were well scrubbed.

These wards are systematically emptied in rotation for thorough purification and exposure to air and sun-light, a matter of great importance in obviating the danger of a gradual contamination of the building.

Students are required to perform ablution and to use disinfectants previously to examining a labour case.

We were glad to find that a new supply of sheeting has been purchased, which will enable the laundry arrangements to be more perfectly carried out than heretofore.

Better provision is required with regard to the linen-room which should have more light and ventilation, and greater facilities should be provided for airing and drying the linen previously to being sent to the wards.

As the patients are often very poor and are not provided with sufficient clothing, we were glad to learn that a supply of shawls has been purchased for their use while in Hospital.

We observed that when parturient patients occupy the labour wards, carbolized vapor, generated by an apparatus specially designed for that purpose, is diffused through the atmosphere.

On the 1st of April, 1882, there were 28 patients in the labour wards; 1,208 were admitted during the year; 1,010 were discharged after delivery; 201 were discharged, not having been delivered; 12 died, and 25 remained in the Hospital at the end of the year.

Twenty-two patients remained in the Auxiliary or Chronic Department on the 1st of April, 1882, 434 were admitted; 418 discharged; 21 died in the year ended 31st March, 1883, and 17 then remained.

The mortality of the labour patients, deducting the 201 non-parturient cases, was 1.18 per cent., and that of the chronic class was 4.78 per cent.

COOMBE.

This Hospital continues to be very satisfactorily conducted, affording considerable relief to extern as well as to intern patients. The entire establishment was in perfect order and the comforts of the patients well attended to.

In our previous reports we have on several occasions adverted to the high cost per bed. The explanations of the Governors have not always been satisfactory; at the same time it must be remembered that a great portion of expenditure is incurred by the Dispensary department in which most of the medicine purchased is given out.

Twelve labour cases remained in Hospital on the 1st of April, 1882; 496 were admitted during the year; 487 were discharged; 10 died, and 11 remained at the close of the year.

Twelve patients remained in the chronic wards on the 1st of April, 1882; 130 were admitted; 122 discharged; 6 died, and 14 remained at the end of the year.

The mortality of patients admitted to the labour wards, deducting 38 that were discharged not having been delivered, was 10 deaths in 459 cases, or 2.18 per cent.; that of the chronic class was 4.68 per cent.

INCURABLES.

The several departments were minutely inspected and found remarkably clean and orderly. The patients appeared to have every comfort and attention paid to them.

The Hospital reflects the highest credit upon the Governors for the admirable manner in which it is maintained.

At the commencement of the year 170 remained in the institution; 52 were admitted; 12 discharged; 47 died, and 163 remained on the 1st March, 1883.

The average daily number of beds occupied was 168.6, and the time spent in Hospital by each patient averaged 277.2 days.

ST. MARK'S.

Every attention is given to the patients, and the internal arrangements of the institution appears to be carried out with great order and regularity. Many of the patients came from distant parts of the country.

In presenting their Annual Report, the Governors desire to call public attention to the great and increasing necessity that exists for additional accommodation both for in-patients and out-patients.

Although the number of beds is only thirty-eight, there have often been as many as forty-two patients in the house, which could only be managed by putting two children to sleep in one bed, or by placing mattresses for adults upon the floor.

This state of things is in itself most objectionable, as apart from the ill effects of overcrowding, the beds in an hospital require rest for airing and cleansing purposes. In spite of all this, deserving applicants have repeatedly been turned away for want of

room, and what is perhaps worse, the medical officers had to make room for urgent cases by dismissing patients who would have benefited by a longer stay in hospital.

Great inconvenience has also been often occasioned by the want of a ward in which children could be kept apart from other patients, many of whom have had their rest interrupted and their cure retarded by the disturbance inseparable from the presence of children.

The Governors are in a position to state that by an expenditure of £600, they could procure accommodation for eight additional adult patients, and also provide a children's ward containing six or eight cots.

In the out-patient department the medical officers have for a long time complained of the inconvenience, discomfort, and great waste of time occasioned by the want of a separate room in which to examine and treat patients suffering from ear disease apart from those afflicted with their eyes. A room does exist in the hospital which could be utilised for the purpose, if £50 were expended in putting it in order, but it cannot be made use of for this object, until the buildings mentioned above are finished.

Thirty patients remained in Hospital on the 31st March, 1882, 721 were admitted, 119 were discharged, and 32 remained at the end of the year.

The average daily number of beds occupied throughout the year was 31·08, and the time spent in Hospital by each patient averaged 15·39 days.
